

# A real world example

consider the following standards of a company for salary

- minimum wage = 1000
- 2000 increase for every year of experience

A two year experienced person will get :

# A real world example

consider the following standards of a company for salary

- minimum wage = 1000
- 2000 increase for every year of experience

A two year experienced person will get : 5600 (He is LUCKY !!)

# A real world example

consider the following standards of a company for salary

- minimum wage = 1000
- 2000 increase for every year of experience

A two year experienced person will get : 5600 (He is LUCKY !!)

How to Model this ?

# A real world example

consider the following standards of a company for salary

- minimum wage = 1000
- 2000 increase for every year of experience

A two year experienced person will get : 5600 (He is LUCKY !!)

How to Model this ?

$$y = b + wx + \epsilon$$

# A real world example

consider the following standards of a company for salary

- minimum wage = 1000
- 2000 increase for every year of experience

A two year experienced person will get : 5600 (He is LUCKY !!)

How to Model this ?

$$y = b + wx + \epsilon$$

- $y = \text{output} \implies \text{salary}$

# A real world example

consider the following standards of a company for salary

- minimum wage = 1000
- 2000 increase for every year of experience

A two year experienced person will get : 5600 (He is LUCKY !!)

How to Model this ?

$$y = b + wx + \epsilon$$

- $y = \text{output} \implies \text{salary}$
- $x = \text{input} \implies \text{experience}$

# A real world example

consider the following standards of a company for salary

- minimum wage = 1000
- 2000 increase for every year of experience

A two year experienced person will get : 5600 (He is LUCKY !!)

How to Model this ?

$$y = b + wx + \epsilon$$

- $y$  = output  $\implies$  salary
- $x$  = input  $\implies$  experience
- $b$  = dc/average value. the value when  $x = 0 \implies$  minimum wage

# A real world example

consider the following standards of a company for salary

- minimum wage = 1000
- 2000 increase for every year of experience

A two year experienced person will get : 5600 (He is LUCKY !!)

## How to Model this ?

$$y = b + wx + \epsilon$$

- $y$  = output  $\Rightarrow$  salary
- $x$  = input  $\Rightarrow$  experience
- $b$  = dc/average value. the value when  $x = 0 \Rightarrow$  minimum wage
- $\epsilon$  = the noise  $\Rightarrow$  Luck !! or HR subjective bias
